ROUND 1 | THE PLAN

The proposal

Knowledge Continuity

A source-grounded handover for small startup teams

THE CHALLENGE

Prevent critical project knowledge from leaving when a team member leaves.

THE PRODUCT

Turn authorised project traces into a reviewed, role-appropriate continuation plan.

THE CORE IDEA

Every claim points to evidence. Every gap stays visible until a person answers or approves it.

> **A practical handover answers: What happened? What is still open? Who owns it? What should happen next-and what evidence supports that view?**

UNDERSTANDING THE PROBLEM

The problem, made specific

The work is recorded. The context is not.

WHERE KNOWLEDGE LIVES

Small teams work across chat threads, task boards, shared documents, repositories and meeting notes. The trail is fragmented, uneven and often written for the moment.

WHAT GOES MISSING

The rationale behind a decision, current ownership, unfinished work, dependencies, recurring issues, risks and the next useful action.

WHO FEELS THE COST

A founder or project owner has to reconstruct context and answer repeat questions. The incoming person waits, repeats discovery work or proceeds with an incomplete picture.

FOCUSED SETTING

Early-stage startups onboarding a new intern after a short-tenure, often unpaid intern leaves. This is the first use case, not the only one.

> **The product addresses a concrete transition: one person leaves, another inherits active work, and the owner has limited time to rebuild the story.**

WHO IT SERVES

Users and the transition

Three people. One accountable handover.

FOUNDER / PROJECT OWNER | REVIEWER

Chooses the project and template, controls access, resolves uncertain claims, approves the final handover and shares it.

DEPARTING INTERN | SOURCE PROVIDER

Contributes permitted documents, notes, task exports or pasted context; answers short questions about gaps while the work is still fresh.

INCOMING INTERN | RECIPIENT

Receives a concise continuation plan with responsibilities, open work, risks, next actions and the evidence they are allowed to see.

PRIMARY SCENARIO

An intern is leaving within days. The founder selects project sources, invites the departing intern to fill missing context, reviews the draft, then shares an access-limited handover with the incoming intern.

> **Success is not a longer summary. It is a faster, safer transfer of enough context to continue the work.**

PROPOSED PRODUCT

The solution

A guided handover workspace

1 | START WITH A TEMPLATE

The owner chooses a handover structure and edits fields to match the project.

2 | ADD AUTHORISED SOURCES

The departing worker or owner pastes text or uploads PDF/DOCX files; a structured export can be added in the scoped build.

3 | EXTRACT WITH EVIDENCE

The system proposes field values and attaches source/chunk citations. It surfaces conflicting evidence instead of silently choosing a version.

4 | CLOSE THE GAPS

Missing fields become short, targeted questions for the person most likely to know the answer.

5 | REVIEW, APPROVE, SHARE

The owner edits or rejects suggestions, approves a version and shares permitted sections with the incoming person.

> **The distinct interaction is gap detection plus guided Q&A-not a one-shot summariser.**

FROM SOURCES TO CONTINUITY

End-to-end workflow

Connect > reconstruct > verify > review > hand over

01 | CONNECT

Owner creates a project, selects a template and adds only sources they are authorised to use. Record source identity and access level.

02 | RECONSTRUCT

Extract relevant decisions, ownership, status, blockers, dependencies, risks and next actions into template fields.

03 | VERIFY

Attach numbered source-chunk references, classify each field Found / Inferred / Missing and identify conflicts.

04 | REVIEW

Ask focused questions for Missing fields; let the owner correct, reject, annotate and approve each item.

05 | HAND OVER

Create a versioned, role-filtered view. The incoming person sees the approved continuation plan and acknowledges receipt.

> **A field only becomes trusted when its evidence is checked and, where judgement is involved, an authorised owner approves it.**

WHAT THE PRODUCT INCLUDES

Features and first release

A small feature set built around trust

TEMPLATES

Five starting templates: Project Handover, Role Handover, Product/Feature, Research/Experiment and Operations. Owners can customise fields.

SOURCE INTAKE

Paste text and upload PDF/DOCX. For the demo, include one structured source such as a GitHub issues CSV export; no live connection.

EVIDENCE-AWARE EXTRACTION

Structured field output with citations to numbered chunks; verify cited text in code before accepting a claim.

VISIBLE UNCERTAINTY

Found, Inferred and Missing states, plus conflict flags and a guided question for each important gap.

CONTROLLED HANDOVER

Owner review and approval, section-level permissions, version history and receipt acknowledgement.

DEMO SAFEGUARD

Use synthetic, public, permissioned or anonymised data. Never connect a personal account just to make the demo look realistic.

> **MVP boundary: one project, a few source formats, five editable templates, and an approval-to-share path.**

BUILDABLE ARCHITECTURE

Technology plan

A thin web app with a traceable data model

FRONTEND | REACT

A familiar component model for the template editor, source intake, field review and role-specific views; quick to prototype.

BACKEND | FASTAPI / PYTHON

A small API for parsing, extraction orchestration and permission checks; Python has mature document-processing and AI tooling.

DATABASE | SQLITE FIRST

Simple local setup for a solo hackathon build. Store projects, templates, fields, sources, chunks, citations, versions and access rules; PostgreSQL is the deployment path.

AI | LLM WITH JSON OUTPUT

Ask for schema-constrained field candidates and evidence references. The model suggests; application checks and owner approval control publication.

PARSING | PDF / DOCX LIBRARIES

Extract text, preserve page or paragraph markers where possible, then split into stable numbered chunks for citation.

DEPLOYMENT

Local or restricted demo environment with synthetic data; keep API keys server-side and avoid sending unauthorised content to a model provider.

> **The stack is intentionally ordinary: low setup overhead leaves more build time for evidence checks and review.**

TECHNICAL DESIGN

How the system earns trust

Getting trustworthy extraction without hallucination

1 | CHUNK THE SOURCES

Assign stable source and chunk IDs, with enough surrounding context to interpret a passage.

2 | REQUIRE CITATIONS

Each proposed value must reference one or more chunk IDs. Reject malformed or unknown references.

3 | CHECK THE EVIDENCE

In code, confirm the cited text exists in the referenced chunk. If it does not, reject the value. A matching quote proves traceability, not truth.

4 | SHOW THE STATE

Found means directly supported; Inferred means a reasoned suggestion needing owner confirmation; Missing means the sources do not answer it. Flag conflicting passages for review.

5 | KEEP A PERSON IN CHARGE

Ask a concise question for Missing fields. Never mark an inference verified until an authorised owner approves it.

> **Originality: a handover that knows what it does not know, asks the right person, and preserves the evidence trail.**

RESPONSIBLE KNOWLEDGE SHARING

Privacy, access and boundaries

Permission follows the information

AUTHORISE BEFORE INGESTION

Only accept sources the project owner is allowed to use. Record source owner and intended audience.

FILTER BEFORE SHARING

Apply access rules at the field/section level; access to a source does not grant access to every derived claim.

MINIMISE EXPOSURE

Use role-based access, redact sensitive details where possible, keep credentials server-side and avoid unnecessary source retention.

KEEP AN AUDIT TRAIL

Record edits, approvals, versions, sharing scope and acknowledgement. A correction should not erase the earlier approved state.

DEMO SAFELY

Use synthetic or permissioned sample project data. The MVP does not need live Slack, GitHub or Notion access.

> **Derived text can reveal sensitive context even when a source excerpt is hidden. Review permissions on the handover itself.**

OWNERSHIP

Solo responsibilities

One builder, clear workstreams

PRODUCT & RESEARCH

Define the first user scenario, template fields and success measures; validate assumptions with a few target users if access permits.

DESIGN & FRONTEND

Create the project setup, source intake, field-state review, approval and recipient screens.

BACKEND & DATA

Implement project/template/source/version models, parsing, API endpoints and section-level access checks.

AI & TRUST

Design extraction schema, chunk citations, deterministic citation checks, uncertainty labels and conflict review.

DEMO & DOCUMENTATION

Prepare an anonymised sample handover, walk-through and honest limitations list.

> **Solo scope principle: finish one end-to-end handover path before expanding integrations or analytics.**

BUILD IN STAGES

Three-round delivery plan

Plan first. Working core second. Three improvements third.

ROUND 1 | THE PLAN

Define the target user and transition, map the workflow, choose the stack and trust model, prepare wireframes and a synthetic example. Deliver this proposal.

ROUND 2 | WORKING CORE

Build one project path: choose a template, paste/upload sources, parse and chunk them, generate cited fields, check references, flag gaps, collect answers, review and approve a handover.

ROUND 3 | THREE PROMISED IMPROVEMENTS

1) Add PDF/DOCX parsing if the core began with pasted text. 2) Add one structured import, such as GitHub issues CSV. 3) Add recipient permissions, version history and acknowledgement. Polish the demo and error handling.

CUT LINE

If time is tight, prioritise source-to-approved-handover, with paste input and one template. Keep integrations, analytics and broad automation outside the MVP.

> **Round 3 improvements are staged commitments; keep them demonstrable and do not make the core workflow depend on live third-party access.**

EXPECTED VALUE

Impact and how to tell

Less reconstruction. More useful first days.

FASTER ONBOARDING

The incoming intern can find current ownership, open work and next actions without searching every channel from scratch.

FEWER LOST DECISIONS

Decision context and unresolved questions stay attached to the handover with traceable supporting sources.

LESS FOUNDER REWORK

The owner reviews a structured draft and resolves highlighted gaps instead of writing every section from memory.

PILOT MEASURES

Compare time to produce a handover; count unanswered critical fields; ask the recipient to find the owner, blocker and next action; record correction rate and permission issues.

EVIDENCE STATUS

These are intended outcomes and proposed measures, not claimed results. Validate them with a small pilot before making impact claims.

> **A good demo shows a recipient answering "what do I do next?" with a cited, approved response.**

LEARN, THEN EXPAND

Validation and future scope

Test the riskiest assumptions early

HYPOTHESES TO TEST

Do founders spend meaningful time rebuilding context? Will departing interns answer targeted questions? Are section-level permissions understandable? Do citations help recipients trust the handover?

LIGHTWEIGHT VALIDATION

Walk through a synthetic scenario with a founder and a recent intern; observe fields needed, disagreements and whether the next step is clear. Do not present this as completed research.

FUTURE | LIVE INTEGRATIONS

GitHub, Slack and Notion connectors, each with explicit authorisation and source-level access handling.

FUTURE | PRODUCT DEPTH

More domain templates, stronger conflict/timeline views, analytics for handover completeness and acknowledgement reminders.

FUTURE | ORGANISATIONAL CONTROLS

Retention policies, enterprise identity integration and configurable audit/export controls after the core trust model is validated.

> **Future scope follows demonstrated user need; the first release proves the handover loop before adding connectors.**

TEAM

Builder and contribution

Solo project

BUILDER

Aadit | Solo builder

PRODUCT & RESEARCH

Defines the user, problem scope, workflow, success measures and demo scenario.

DESIGN & ENGINEERING

Owns the interface, frontend, backend, database, document parsing and AI extraction flow.

TRUST & DELIVERY

Implements citation checks, uncertainty states, permissions, review/version workflow and final demonstration.

TEAM MODEL

One person is accountable for planning, implementation, validation and presentation. The round plan prioritises one complete vertical slice.

> **A solo submission is feasible because the first release focuses on one transition workflow and avoids live integration dependencies.**

THE PROMISE

Closing: continuity with evidence

A handover people can act on-and inspect.

FOR THE OWNER

Review one structured view, resolve the gaps that matter and control what gets shared.

FOR THE DEPARTING PERSON

Leave behind decisions and context while they are still easy to explain.

FOR THE NEXT PERSON

Start with ownership, open questions, risks and a clear next action linked to approved evidence.

> **Knowledge Continuity turns scattered project activity into a role-appropriate, evidence-linked handover-with uncertainty visible and a human accountable for approval.**
